

Abdominal blocks, in particular TAP-blocks (transverse abdominis plane blocks) and rectus sheath blocks, are increasingly being used for the management of postoperative pain from abdominal surgery.

They are applicable to day surgery, have a low side effect profile and offer an alternative to epidural anaesthesia for abdominal surgery. Ultrasound guidance has improved the accuracy of inserting abdominal blocks but cannula tip visibility has been a problem.

As the forerunner in new technology in the field of regional anaesthesia, PAJUNK® has developed the Sono range of cannula, designed specifically to optimize cannula tip visibility. The aim is safe, reliable analgesia.

PAJUNK® offers two systems for the performance of TAP- and rectus sheath blocks:

- The SonoTAP cannula for single shot techniques
- The EpiLong Soft Sono Set with a TuohySono cannula for continuous techniques
